Chapter 5- Arithmetic Progressions

EXERCISE 5.1

Choose the correct answer from the given four options in the following questions:

1. In an AP, if $d = -4$, $n = 7$, $a_n = 4$, then a is

- (A) 6 (B) 7 (C) 20 (D) 28

Solution:

(D) 28

Explanation:

We know that n th term of an AP is

$$a_n = a + (n - 1)d$$

where,

a = first term

a_n is n th term

d is the common difference

According to the question,

$$4 = a + (7 - 1)(-4)$$

$$4 = a - 24$$

$$a = 24 + 4 = 28$$

2. In an AP, if $a = 3.5$, $d = 0$, $n = 101$, then a_n will be

- (A) 0 (B) 3.5 (C) 103.5 (D) 104.5

Solution:

(B) 3.5

Explanation:

We know that n th term of an AP is

$$a_n = a + (n - 1)d$$

Where,

a = first term

a_n is n th term

d is the common difference

$$a_n = 3.5 + (101 - 1)0$$

$$= 3.5$$

(Since, $d = 0$, it's a constant A.P)

3. The list of numbers $-10, -6, -2, 2, \dots$ is

- (A) an AP with $d = -16$
(B) an AP with $d = 4$
(C) an AP with $d = -4$
(D) not an AP

Solution:

(B) an AP with $d = 4$

Explanation:

According to the question,

$$a_1 = -10$$

$$a_2 = -6$$

$a_3 = -2$
 $a_4 = 2$
 $a_2 - a_1 = 4$
 $a_3 - a_2 = 4$
 $a_4 - a_3 = 4$
 $a_2 - a_1 = a_3 - a_2 = a_4 - a_3 = 4$
 Therefore, it's an A.P with $d = 4$

4. The 11th term of the AP: $-5, (-5/2), 0, 5/2, \dots$ is
 (A) -20 (B) 20 (C) -30 (D) 30

Solution:

(B) 20

Explanation:

First term, $a = -5$

Common difference,

$$d = 5 - (-5/2) = 5/2$$

$$n = 11$$

We know that the n th term of an AP is

$$a_n = a + (n - 1)d$$

Where,

a = first term

a_n is n th term

d is the common difference

$$a_{11} = -5 + (11 - 1)(5/2)$$

$$a_{11} = -5 + 25 = 20$$

5. The first four terms of an AP, whose first term is -2 and the common difference is -2 , are

(A) $-2, 0, 2, 4$

(B) $-2, 4, -8, 16$

(C) $-2, -4, -6, -8$

(D) $-2, -4, -8, -16$

Solution:

(C) $-2, -4, -6, -8$

Explanation:

First term, $a = -2$

Second Term, $d = -2$

$$a_1 = a = -2$$

We know that the n th term of an AP is

$$a_n = a + (n - 1)d$$

Where,

a = first term

a_n is n th term

d is the common difference

Hence, we have,

$$a_2 = a + d = -2 + (-2) = -4$$

Similarly,

$a_3 = -6$
 $a_4 = -8$
So the A.P is
- 2, - 4, - 6, - 8

6. The 21st term of the AP whose first two terms are -3 and 4 is
(A) 17 (B) 137 (C) 143 (D) -143

Solution:

(B) 137

Explanation:

First two terms of an AP are $a = -3$ and $a_2 = 4$.

We know, nth term of an AP is

$$a_n = a + (n - 1)d$$

Where,

a = first term

a_n is nth term

d is the common difference

$$a_2 = a + d$$

$$4 = -3 + d$$

$$d = 7$$

Common difference, $d = 7$

$$a_{21} = a + 20d$$

$$= -3 + (20)(7)$$

$$= 137$$

7. If the 2nd term of an AP is 13 and the 5th term is 25, what is its 7th term?
(A) 30 (B) 33 (C) 37 (D) 38

Solution:

(B) 33

Explanation:

We know that the nth term of an AP is

$$a_n = a + (n - 1)d$$

Where,

a = first term

a_n is nth term

d is the common difference

$$a_2 = a + d = 13 \dots\dots(1)$$

$$a_5 = a + 4d = 25 \dots\dots(2)$$

From equation (1) we have,

$$a = 13 - d$$

Using this in equation (2), we have

$$13 - d + 4d = 25$$

$$13 + 3d = 25$$

$$3d = 12$$

$$d = 4$$

$$a = 13 - 4 = 9$$

$$\begin{aligned}
 a_7 &= a + 6d \\
 &= 9 + 6(4) \\
 &= 9 + 24 = 33
 \end{aligned}$$

8. Which term of the AP: 21, 42, 63, 84... is 210?

- (A) 9th (B) 10th (C) 11th (D) 12th

Solution:

(B) 10th

Explanation:

Let nth term of the given AP be 210.

According to question,

first term, $a = 21$

common difference, $d = 42 - 21 = 21$ and $a_n = 210$

We know that the nth term of an AP is

$$a_n = a + (n - 1)d$$

Where,

a = first term

a_n is nth term

d is the common difference

$$210 = 21 + (n - 1)21$$

$$189 = (n - 1)21$$

$$n - 1 = 9$$

$$n = 10$$

So, 10th term of an AP is 210.

9. If the common difference of an AP is 5, then what is $a_{18} - a_{13}$?

- (A) 5 (B) 20 (C) 25 (D) 30

Solution:

(C) 25

Explanation:

Given, the common difference of AP i.e., $d = 5$

Now,

As we know, nth term of an AP is

$$a_n = a + (n - 1)d$$

where a = first term

a_n is nth term

d is the common difference

$$a_{18} - a_{13} = a + 17d - (a + 12d)$$

$$= 5d$$

$$= 5(5)$$

$$= 25$$

1. Which of the following form an AP? Justify your answer.

(i) $-1, -1, -1, -1, \dots$

Solution:

We have $a_1 = -1$, $a_2 = -1$, $a_3 = -1$ and $a_4 = -1$

$$a_2 - a_1 = 0$$

$$a_3 - a_2 = 0$$

$$a_4 - a_3 = 0$$

Clearly, the difference of successive terms is same, therefore given list of numbers form an AP.

(ii) $0, 2, 0, 2, \dots$

Solution:

We have $a_1 = 0$, $a_2 = 2$, $a_3 = 0$ and $a_4 = 2$

$$a_2 - a_1 = 2$$

$$a_3 - a_2 = -2$$

$$a_4 - a_3 = 2$$

Clearly, the difference of successive terms is not same, therefore given list of numbers does not form an AP.

(iii) $1, 1, 2, 2, 3, 3, \dots$

Solution:

We have $a_1 = 1$, $a_2 = 1$, $a_3 = 2$ and $a_4 = 2$

$$a_2 - a_1 = 0$$

$$a_3 - a_2 = 1$$

Clearly, the difference of successive terms is not same, therefore given list of numbers does not form an AP.

(iv) $11, 22, 33, \dots$

Solution:

We have $a_1 = 11$, $a_2 = 22$ and $a_3 = 33$

$$a_2 - a_1 = 11$$

$$a_3 - a_2 = 11$$

Clearly, the difference of successive terms is same, therefore given list of numbers form an AP.

(v) $1/2, 1/3, 1/4, \dots$

Solution:

We have $a_1 = 1/2$, $a_2 = 1/3$ and $a_3 = 1/4$

$$a_2 - a_1 = -1/6$$

$$a_3 - a_2 = -1/12$$

Clearly, the difference of successive terms is not same, therefore given list of numbers does not form an AP.

(vi) $2, 2^2, 2^3, 2^4, \dots$

Solution:

We have $a_1 = 2$, $a_2 = 2^2$, $a_3 = 2^3$ and $a_4 = 2^4$

$$a_2 - a_1 = 2^2 - 2 = 4 - 2 = 2$$

$$a_3 - a_2 = 2^3 - 2^2 = 8 - 4 = 4$$

Clearly, the difference of successive terms is not same, therefore given list of numbers does not form an AP.

(vii) $\sqrt{3}, \sqrt{12}, \sqrt{27}, \sqrt{48}, \dots$

Solution:

We have,

$$a_1 = \sqrt{3}, a_2 = \sqrt{12}, a_3 = \sqrt{27} \text{ and } a_4 = \sqrt{48}$$

$$a_2 - a_1 = \sqrt{12} - \sqrt{3} = 2\sqrt{3} - \sqrt{3} = \sqrt{3}$$

$$a_3 - a_2 = \sqrt{27} - \sqrt{12} = 3\sqrt{3} - 2\sqrt{3} = \sqrt{3}$$

$$a_4 - a_3 = \sqrt{48} - \sqrt{27} = 4\sqrt{3} - 3\sqrt{3} = \sqrt{3}$$

Clearly, the difference of successive terms is same, therefore given list of numbers form an AP.

2. Justify whether it is true to say that $-1, -3/2, -2, 5/2, \dots$ forms an AP as

$$a_2 - a_1 = a_3 - a_2.$$

Solution:

False

$$a_1 = -1, a_2 = -3/2, a_3 = -2 \text{ and } a_4 = 5/2$$

$$a_2 - a_1 = -3/2 - (-1) = -1/2$$

$$a_3 - a_2 = -2 - (-3/2) = -1/2$$

$$a_4 - a_3 = 5/2 - (-2) = 9/2$$

Clearly, the difference of successive terms is not same, all though, $a_2 - a_1 = a_3 - a_2$ but $a_4 - a_3 \neq a_3 - a_2$ therefore it does not form an AP.

3. For the AP: $-3, -7, -11, \dots$, can we find directly $a_{30} - a_{20}$ without actually finding a_{30} and a_{20} ?

Give reasons for your answer.

Solution:

True

Given

First term, $a = -3$

$$\text{Common difference, } d = a_2 - a_1 = -7 - (-3) = -4$$

$$a_{30} - a_{20} = a + 29d - (a + 19d)$$

$$= 10d$$

$$= -40$$

It is so because difference between any two terms of an AP is proportional to common difference of that AP

4. Two APs have the same common difference. The first term of one AP is 2 and that of the other is 7. The difference between their 10th terms is the same as the difference between their 21st

terms, which is the same as the difference between any two corresponding terms. Why?

Solution:

Suppose there are two AP's with first terms a and A

And their common differences are d and D respectively

Suppose n be any term

$$a_n = a + (n - 1)d$$

$$A_n = A + (n - 1)D$$

As common difference is equal for both AP's

We have $D = d$

Using this we have

$$A_n - a_n = a + (n - 1)d - [A + (n - 1)D]$$

$$= a + (n - 1)d - A - (n - 1)d$$

$$= a - A$$

As $a - A$ is a constant value

Therefore, difference between any corresponding terms will be equal to $a - A$.

EXERCISE 5.3

1. Match the APs given in column A with suitable common differences given in column B.

Column A		Column B	
(A ₁)	2, - 2, - 6, -10,...	(B ₁)	2/3
(A ₂)	$a = -18, n = 10, a_n = 0$	(B ₂)	- 5
(A ₃)	$a = 0, a_{10} = 6$	(B ₃)	4
(A ₄)	$a_2 = 13, a_4 = 3$	(B ₄)	- 4
		(B ₅)	2
		(B ₆)	1/2
		(B ₇)	5

Solution:

(A₁) AP is 2, - 2, - 6, - 10, ...
So common difference is simply
 $a_2 - a_1 = - 2 - 2 = - 4 = (B_3)$

(A₂) Given
First term, $a = - 18$
No of terms, $n = 10$
Last term, $a_n = 0$
By using the nth term formula
 $a_n = a + (n - 1)d$
 $0 = - 18 + (10 - 1)d$
 $18 = 9d$
 $d = 2 = (B_5)$

(A₃) Given
First term, $a = 0$
Tenth term, $a_{10} = 6$
By using the nth term formula
 $a_n = a + (n - 1)d$
 $a_{10} = a + 9d$
 $6 = 0 + 9d$
 $d = 2/3 = (B_6)$

(A₄) Let the first term be a and common difference be d
Given that
 $a_2 = 13$
 $a_4 = 3$
 $a_2 - a_4 = 10$
 $a + d - (a + 3d) = 10$
 $d - 3d = 10$
 $- 2d = 10$
 $d = - 5 = (B_1)$

2. Verify that each of the following is an AP, and then write its next three terms.

(i) 0, $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$,...

Solution:

Here,

$$a_1 = 0$$

$$a_2 = \frac{1}{4}$$

$$a_3 = \frac{1}{2}$$

$$a_4 = \frac{3}{4}$$

$$a_2 - a_1 = \frac{1}{4} - 0 = \frac{1}{4}$$

$$a_3 - a_2 = \frac{1}{2} - \frac{1}{4} = \frac{1}{4}$$

$$a_4 - a_3 = \frac{3}{4} - \frac{1}{2} = \frac{1}{4}$$

Since, difference of successive terms are equal,

Hence, 0, $\frac{1}{4}$, $\frac{1}{2}$, $\frac{3}{4}$,... is an AP with common difference $\frac{1}{4}$.

Therefore, the next three term will be,

$$\frac{3}{4} + \frac{1}{4}, \frac{3}{4} + 2(\frac{1}{4}), \frac{3}{4} + 3(\frac{1}{4})$$

$$1, \frac{5}{4}, \frac{3}{2}$$

(ii) 5, $\frac{14}{3}$, $\frac{13}{3}$, 4...

Solution:

Here,

$$a_1 = 5$$

$$a_2 = \frac{14}{3}$$

$$a_3 = \frac{13}{3}$$

$$a_4 = 4$$

$$a_2 - a_1 = \frac{14}{3} - 5 = -\frac{1}{3}$$

$$a_3 - a_2 = \frac{13}{3} - \frac{14}{3} = -\frac{1}{3}$$

$$a_4 - a_3 = 4 - \frac{13}{3} = -\frac{1}{3}$$

Since, difference of successive terms are equal,

Hence, 5, $\frac{14}{3}$, $\frac{13}{3}$, 4... is an AP with common difference $-\frac{1}{3}$.

Therefore, the next three term will be,

$$4 + (-\frac{1}{3}), 4 + 2(-\frac{1}{3}), 4 + 3(-\frac{1}{3})$$

$$\frac{11}{3}, \frac{10}{3}, 3$$

(iii) $\sqrt{3}$, $2\sqrt{3}$, $3\sqrt{3}$,...

Solution:

Here,

$$a_1 = \sqrt{3}$$

$$a_2 = 2\sqrt{3}$$

$$a_3 = 3\sqrt{3}$$

$$a_4 = 4\sqrt{3}$$

$$a_2 - a_1 = 2\sqrt{3} - \sqrt{3} = \sqrt{3}$$

$$a_3 - a_2 = 3\sqrt{3} - 2\sqrt{3} = \sqrt{3}$$

$$a_4 - a_3 = 4\sqrt{3} - 3\sqrt{3} = \sqrt{3}$$

Since, difference of successive terms are equal,

Hence, $\sqrt{3}$, $2\sqrt{3}$, $3\sqrt{3}$,... is an AP with common difference $\sqrt{3}$.

Therefore, the next three term will be,

$$4\sqrt{3} + \sqrt{3}, 4\sqrt{3} + 2\sqrt{3}, 4\sqrt{3} + 3\sqrt{3}$$

$$5\sqrt{3}, 6\sqrt{3}, 7\sqrt{3}$$

(iv) $a + b, (a + 1) + b, (a + 1) + (b + 1), \dots$

Solution:

Here

$$a_1 = a + b$$

$$a_2 = (a + 1) + b$$

$$a_3 = (a + 1) + (b + 1)$$

$$a_2 - a_1 = (a + 1) + b - (a + b) = 1$$

$$a_3 - a_2 = (a + 1) + (b + 1) - (a + 1) - b = 1$$

Since, difference of successive terms are equal,

Hence, $a + b, (a + 1) + b, (a + 1) + (b + 1), \dots$ is an AP with common difference 1.

Therefore, the next three term will be,

$$(a + 1) + (b + 1) + 1, (a + 1) + (b + 1) + 1(2), (a + 1) + (b + 1) + 1(3)$$

$$(a + 2) + (b + 1), (a + 2) + (b + 2), (a + 3) + (b + 2)$$

(v) $a, 2a + 1, 3a + 2, 4a + 3, \dots$

Solution:

Here $a_1 = a$

$$a_2 = 2a + 1$$

$$a_3 = 3a + 2$$

$$a_4 = 4a + 3$$

$$a_2 - a_1 = (2a + 1) - (a) = a + 1$$

$$a_3 - a_2 = (3a + 2) - (2a + 1) = a + 1$$

$$a_4 - a_3 = (4a + 3) - (3a + 2) = a + 1$$

Since, difference of successive terms are equal,

Hence, $a, 2a + 1, 3a + 2, 4a + 3, \dots$ is an AP with common difference $a + 1$.

Therefore, the next three term will be,

$$4a + 3 + (a + 1), 4a + 3 + 2(a + 1), 4a + 3 + 3(a + 1)$$

$$5a + 4, 6a + 5, 7a + 6$$

3. Write the first three terms of the APs when a and d are as given below:

(i) $a = 1/2, d = -1/6$

(ii) $a = -5, d = -3$

(iii) $a = 2, d = 1/\sqrt{2}$

Solution:

(i) $a = 1/2, d = -1/6$

We know that,

First three terms of AP are :

$$a, a + d, a + 2d$$

$$\frac{1}{2}, \frac{1}{2} + (-1/6), \frac{1}{2} + 2(-1/6)$$

$$\frac{1}{2}, \frac{1}{3}, \frac{1}{6}$$

(ii) $a = -5, d = -3$

We know that,

First three terms of AP are :

$$a, a + d, a + 2d$$

$$-5, -5 + 1(-3), -5 + 2(-3)$$

$$-5, -8, -11$$

(iii) $a = \sqrt{2}, d = 1/\sqrt{2}$

We know that,

First three terms of AP are :

$$a, a + d, a + 2d$$

$$\sqrt{2}, \sqrt{2} + 1/\sqrt{2}, \sqrt{2} + 2/\sqrt{2}$$

$$\sqrt{2}, 3/\sqrt{2}, 4/\sqrt{2}$$

4. Find a, b and c such that the following numbers are in AP: a, 7, b, 23, c.

Solution:

For a, 7, b, 23, c... to be in AP

it has to satisfy the condition,

$$a_5 - a_4 = a_4 - a_3 = a_3 - a_2 = a_2 - a_1 = d$$

Where d is the common difference

$$7 - a = b - 7 = 23 - b = c - 23 \dots (1)$$

Let us equate,

$$b - 7 = 23 - b$$

$$2b = 30$$

$$b = 15 \text{ (eqn 1)}$$

And,

$$7 - a = b - 7$$

From eqn 1

$$7 - a = 15 - 7$$

$$a = -1$$

And,

$$c - 23 = 23 - b$$

$$c - 23 = 23 - 15$$

$$c - 23 = 8$$

$$c = 31$$

$$\text{So } a = -1$$

$$b = 15$$

$$c = 31$$

Then, we can say that, the sequence -1, 7, 15, 23, 31 is an AP

5. Determine the AP whose fifth term is 19 and the difference of the eighth term from the thirteenth term is 20.

Solution:

We know that,

The first term of an AP = a

And, the common difference = d.

According to the question,

$$5^{\text{th}} \text{ term, } a_5 = 19$$

Using the n^{th} term formula,

$$a_n = a + (n - 1)d$$

We get,

$$a + 4d = 19$$

$$a = 19 - 4d \dots(1)$$

Also,

$$20^{\text{th}} \text{ term} - 8^{\text{th}} \text{ term} = 20$$

$$a + 19d - (a + 7d) = 20$$

$$12d = 20$$

$$d = 4/3$$

Substituting $d = 4/3$ in equation 1,

We get,

$$a = 19 - 4(4/3)$$

$$a = 41/3$$

Then, the AP becomes,

$$41/3, 41/3 + 4/3, 41/3 + 2(4/3)$$

$$41/3, 15, 49/3$$

EXERCISE 5.4

1. The sum of the first five terms of an AP and the sum of the first seven terms of the same AP is 167. If the sum of the first ten terms of this AP is 235, find the sum of its first twenty terms.

Solution:

We know that, in an A.P.,

First term = a

Common difference = d

Number of terms of an AP = n

According to the question,

We have,

$$S_5 + S_7 = 167$$

Using the formula for sum of n terms,

$$S_n = (n/2) [2a + (n-1)d]$$

So, we get,

$$(5/2) [2a + (5-1)d] + (7/2) [2a + (7-1)d] = 167$$

$$5(2a + 4d) + 7(2a + 6d) = 334$$

$$10a + 20d + 14a + 42d = 334$$

$$24a + 62d = 334$$

$$12a + 31d = 167$$

$$12a = 167 - 31d \dots(1)$$

We have,

$$S_{10} = 235$$

$$(10/2) [2a + (10-1)d] = 235$$

$$5[2a + 9d] = 235$$

$$2a + 9d = 47$$

Multiplying L.H.S and R.H.S by 6,

We get,

$$12a + 54d = 282$$

From equation (1)

$$167 - 31d + 54d = 282$$

$$23d = 282 - 167$$

$$23d = 115$$

$$d = 5$$

Substituting the value of $d = 5$ in equation (1)

$$12a = 167 - 31(5)$$

$$12a = 167 - 155$$

$$12a = 12$$

$$a = 1$$

We know that,

$$S_{20} = (n/2) [2a + (20 - 1)d]$$

$$= 20/(2[2(1) + 19(5)])$$

$$= 10[2 + 95]$$

$$= 970$$

Therefore, the sum of first 20 terms is 970.

2. Find the

- (i) Sum of those integers between 1 and 500 which are multiples of 2 as well as of 5.
- (ii) Sum of those integers from 1 to 500 which are multiples of 2 as well as of 5 .
- (iii) Sum of those integers from 1 to 500 which are multiples of 2 or 5.

[Hint (iii): These numbers will be: multiples of 2 + multiples of 5 – multiples of 2 as well as of 5]

Solution:

- (i) Sum of those integers between 1 and 500 which are multiples of 2 as well as of 5.

We know that,

Multiples of 2 as well as of 5 = LCM of (2, 5) = 10

Multiples of 2 as well as of 5 between 1 and 500 = 10, 20, 30..., 490.

Hence,

We can conclude that 10, 20, 30..., 490 is an AP with common difference, $d = 10$

First term, $a = 10$

Let the number of terms in this AP = n

Using n^{th} term formula,

$$a_n = a + (n - 1)d$$

$$490 = 10 + (n - 1)10$$

$$480 = (n - 1)10$$

$$n - 1 = 48$$

$$n = 49$$

Sum of an AP,

$$S_n = (n/2) [a + a_n], \text{ here } a_n \text{ is the last term, which is given}$$

$$= (49/2) \times [10 + 490]$$

$$= (49/2) \times [500]$$

$$= 49 \times 250$$

$$= 12250$$

Therefore, sum of those integers between 1 and 500 which are multiples of 2 as well as of 5 = 12250

- (ii) Sum of those integers from 1 to 500 which are multiples of 2 as well as of 5.

We know that,

Multiples of 2 as well as of 5 = LCM of (2, 5) = 10

Multiples of 2 as well as of 5 from 1 and 500 = 10, 20, 30..., 500.

Hence,

We can conclude that 10, 20, 30..., 500 is an AP with common difference, $d = 10$

First term, $a = 10$

Let the number of terms in this AP = n

Using n^{th} term formula,

$$a_n = a + (n - 1)d$$

$$500 = 10 + (n - 1)10$$

$$490 = (n - 1)10$$

$$n - 1 = 49$$

$$n = 50$$

Sum of an AP,

$$S_n = (n/2) [a + a_n], \text{ here } a_n \text{ is the last term, which is given}$$

$$\begin{aligned}
 &= (50/2) \times [10+500] \\
 &= 25 \times [10 + 500] \\
 &= 25(510) \\
 &= 12750
 \end{aligned}$$

Therefore, sum of those integers from 1 to 500 which are multiples of 2 as well as of 5= 12750

(iii) Sum of those integers from 1 to 500 which are multiples of 2 or 5.

We know that,

Multiples of 2 or 5 = Multiple of 2 + Multiple of 5 – Multiple of LCM (2, 5)

Multiples of 2 or 5 = Multiple of 2 + Multiple of 5 – Multiple of LCM (10)

Multiples of 2 or 5 from 1 to 500 = List of multiple of 2 from 1 to 500 + List of multiple of 5 from 1 to 500 - List of multiple of 10 from 1 to 500
 $= (2, 4, 6... 500) + (5, 10, 15... 500) - (10, 20, 30... 500)$

Required sum = sum(2, 4, 6,..., 500) + sum(5, 10, 15,..., 500) - sum(10, 20, 30,.., 500)

Consider the first series,

2, 4, 6, ..., 500

First term, $a = 2$

Common difference, $d = 2$

Let n be no of terms

$$a_n = a + (n - 1)d$$

$$500 = 2 + (n - 1)2$$

$$498 = (n - 1)2$$

$$n - 1 = 249$$

$$n = 250$$

$$\text{Sum of an AP, } S_n = (n/2) [a + a_n]$$

Let the sum of this AP be S_1 ,

$$S_1 = S_{250} = (250/2) \times [2+500]$$

$$S_1 = 125(502)$$

$$S_1 = 62750 \dots (1)$$

Consider the second series,

5, 10, 15, ..., 500

First term, $a = 5$

Common difference, $d = 5$

Let n be no of terms

By nth term formula

$$a_n = a + (n - 1)d$$

$$500 = 5 + (n - 1)5$$

$$495 = (n - 1)5$$

$$n - 1 = 99$$

$$n = 100$$

$$\text{Sum of an AP, } S_n = (n/2) [a + a_n]$$

Let the sum of this AP be S_2 ,

$$S_2 = S_{100} = (100/2) \times [5+500]$$

$$S_2 = 50(505)$$

$$S_2 = 25250 \dots (2)$$

Consider the third series,

10, 20, 30, ..., 500

First term, $a = 10$

Common difference, $d = 10$

Let n be no of terms

$$a_n = a + (n - 1)d$$

$$500 = 10 + (n - 1)10$$

$$490 = (n - 1)10$$

$$n - 1 = 49$$

$$n = 50$$

Sum of an AP, $S_n = (n/2) [a + a_n]$

Let the sum of this AP be S_3 ,

$$S_3 = S_{50} = (50/2) \times [2 + 510]$$

$$S_3 = 25(510)$$

$$S_3 = 12750 \dots (3)$$

Therefore, the required Sum, $S = S_1 + S_2 - S_3$

$$S = 62750 + 25250 - 12750$$

$$= 75250$$

3. The eighth term of an AP is half its second term and the eleventh term exceeds one third of its fourth term by 1. Find the 15th term.

Solution:

We know that,

First term of an AP = a

Common difference of AP = d

n^{th} term of an AP, $a_n = a + (n - 1)d$

According to the question,

$$a_8 = \frac{1}{2} a_2$$

$$2a_8 = a_2$$

$$2(a + 7d) = a + d$$

$$2a + 14d = a + d$$

$$a = -13d \dots (1)$$

Also,

$$a_{11} = \frac{1}{3} a_4 + 1$$

$$3(a + 10d) = a + 3d + 3$$

$$3a + 30d = a + 3d + 3$$

$$2a + 27d = 3$$

Substituting $a = -13d$ in the equation,

$$2(-13d) + 27d = 3$$

$$d = 3$$

Then,

$$a = -13(3) = -39$$

Now,

$$\begin{aligned}
 a_{15} &= a + 14d \\
 &= -39 + 14(3) \\
 &= -39 + 42 \\
 &= 3
 \end{aligned}$$

So 15th term is 3.

4. An AP consists of 37 terms. The sum of the three middle most terms is 225 and the sum of the last three is 429. Find the AP.

Solution:

We know that,

First term of an AP = a

Common difference of AP = d

nth term of an AP, $a_n = a + (n - 1)d$

Since, n = 37 (odd),

Middle term will be $(n+1)/2 = 19^{\text{th}}$ term

Thus, the three middle most terms will be,

18th, 19th and 20th terms

According to the question,

$$a_{18} + a_{19} + a_{20} = 225$$

$$\text{Using } a_n = a + (n - 1)d$$

$$a + 17d + a + 18d + a + 19d = 225$$

$$3a + 54d = 225$$

$$3a = 225 - 54d$$

$$a = 75 - 18d \dots (1)$$

Now, we know that last three terms will be 35th, 36th and 37th terms.

According to the question,

$$a_{35} + a_{36} + a_{37} = 429$$

$$a + 34d + a + 35d + a + 36d = 429$$

$$3a + 105d = 429$$

$$a + 35d = 143$$

Substituting $a = 75 - 18d$ from equation 1,

$$75 - 18d + 35d = 143 \text{ [using eqn1]}$$

$$17d = 68$$

$$d = 4$$

Then,

$$a = 75 - 18(4)$$

$$a = 3$$

Therefore, the AP is a, a + d, a + 2d...

i.e. 3, 7, 11....

5. Find the sum of the integers between 100 and 200 that are

(i) divisible by 9

(ii) not divisible by 9

[Hint (ii): These numbers will be: Total numbers – Total numbers divisible by 9]

Solution:

- (i) The number between 100 and 200 which is divisible by 9 = 108, 117, 126, ... 198

Let the number of terms between 100 and 200 which is divisible by 9 = n

$$a_n = a + (n - 1)d$$

$$198 = 108 + (n - 1)9$$

$$90 = (n - 1)9$$

$$n - 1 = 10$$

$$n = 11$$

$$\text{Sum of an AP} = S_n = (n/2) [a + a_n]$$

$$S_n = (11/2) \times [108 + 198]$$

$$= (11/2) \times 306$$

$$= 11(153)$$

$$= 1683$$

- (ii) Sum of the integers between 100 and 200 which is not divisible by 9 = (sum of total numbers between 100 and 200) – (sum of total numbers between 100 and 200 which is divisible by 9)

$$\text{Sum, } S = S_1 - S_2$$

Here,

$$S_1 = \text{sum of AP } 101, 102, 103, \dots, 199$$

$$S_2 = \text{sum of AP } 108, 117, 126, \dots, 198$$

$$\text{For AP } 101, 102, 103, \dots, 199$$

$$\text{First term, } a = 101$$

$$\text{Common difference, } d = 1$$

$$\text{Number of terms} = n$$

Then,

$$a_n = a + (n - 1)d$$

$$199 = 101 + (n - 1)1$$

$$98 = (n - 1)$$

$$n = 99$$

$$\text{Sum of an AP} = S_n = (n/2) [a + a_n]$$

Sum of this AP,

$$S_1 = (99/2) \times [199 + 101]$$

$$= (99/2) \times 300$$

$$= 99(150)$$

$$= 14850$$

$$\text{For AP } 108, 117, 126, \dots, 198$$

$$\text{First term, } a = 108$$

$$\text{Common difference, } d = 9$$

$$\text{Last term, } a_n = 198$$

$$\text{Number of terms} = n$$

Then,

$$a_n = a + (n - 1)d$$

$$198 = 108 + (n - 1)9$$

$$90 = (n - 1)$$

$$n = 11$$

Sum of an AP = $S_n = (n/2) [a + a_n]$

Sum of this AP,

$$\begin{aligned} S_2 &= (11/2) \times [108 + 198] \\ &= (11/2) \times (306) \\ &= 11(153) \\ &= 1683 \end{aligned}$$

Substituting the value of S_1 and S_2 in the equation, $S = S_1 - S_2$

$$\begin{aligned} S &= S_1 + S_2 \\ &= 14850 - 1683 \\ &= 13167 \end{aligned}$$

RESOURCES

JOIN SCHOOL OF EDUCATORS WHATSAPP GROUPS FOR FREE EDUCATIONAL RESOURCES

We are thrilled to introduce the School of Educators WhatsApp Group, a platform designed exclusively for educators to enhance your teaching & Learning experience and learning outcomes. Here are some of the key benefits you can expect from joining our group:

BENEFITS OF SOE WHATSAPP GROUPS

- **Abundance of Content:** Members gain access to an extensive repository of educational materials tailored to their class level. This includes various formats such as PDFs, Word files, PowerPoint presentations, lesson plans, worksheets, practical tips, viva questions, reference books, smart content, curriculum details, syllabus, marking schemes, exam patterns, and blueprints. This rich assortment of resources enhances teaching and learning experiences.
- **Immediate Doubt Resolution:** The group facilitates quick clarification of doubts. Members can seek assistance by sending messages, and experts promptly respond to queries. This real-time interaction fosters a supportive learning environment where educators and students can exchange knowledge and address concerns effectively.
- **Access to Previous Years' Question Papers and Topper Answers:** The group provides access to previous years' question papers (PYQ) and exemplary answer scripts of toppers. This resource is invaluable for exam preparation, allowing individuals to familiarize themselves with the exam format, gain insights into scoring techniques, and enhance their performance in assessments.

- **Free and Unlimited Resources:** Members enjoy the benefit of accessing an array of educational resources without any cost restrictions. Whether its study materials, teaching aids, or assessment tools, the group offers an abundance of resources tailored to individual needs. This accessibility ensures that educators and students have ample support in their academic endeavors without financial constraints.
- **Instant Access to Educational Content:** SOE WhatsApp groups are a platform where teachers can access a wide range of educational content instantly. This includes study materials, notes, sample papers, reference materials, and relevant links shared by group members and moderators.
- **Timely Updates and Reminders:** SOE WhatsApp groups serve as a source of timely updates and reminders about important dates, exam schedules, syllabus changes, and academic events. Teachers can stay informed and well-prepared for upcoming assessments and activities.
- **Interactive Learning Environment:** Teachers can engage in discussions, ask questions, and seek clarifications within the group, creating an interactive learning environment. This fosters collaboration, peer learning, and knowledge sharing among group members, enhancing understanding and retention of concepts.
- **Access to Expert Guidance:** SOE WhatsApp groups are moderated by subject matter experts, teachers, or experienced educators can benefit from their guidance, expertise, and insights on various academic topics, exam strategies, and study techniques.

Join the School of Educators WhatsApp Group today and unlock a world of resources, support, and collaboration to take your teaching to new heights. To join, simply click on the group links provided below or send a message to +91-95208-77777 expressing your interest.

**Together, let's empower ourselves & Our Students and
inspire the next generation of learners.**

**Best Regards,
Team
School of Educators**
